Measurement data is stored in the sensor probe offering the convenience to deploy the sensor probe without cable and control unit for continuous monitoring.

Selection of a cable and ion sensors are necessary to complete a multi-probe system.

Up to one month

Data logging

Simultaneous measurement of

13 parameters

Measurement at depths as low as

100 meters

This system is optimal for assessment and testing of the water quality of sea water, river water, dams, well water, ground water, city water, storm water run-off, lakes, ponds, and fish farms. Horiba's sensor design, which has been developed over the course of many years, is housed in a 47mm diameter sensor probe. Horiba's sensor advances broaden application options in pressurized conditions and continuous monitoring while offering high precision and simultaneous measurement of as many as 13 parameters.

The system is compatible with GPS and data retrieval options to process and manage data on a personal computer. Continuous monitoring is possible for one month deploying the sensor probe at the site to collect data at 15 minute intervals.

Note:The accuracy rating value is obtained from measurements at an intermediate point of the standard solution after two-point calibration (at room temperature and pressure).
The repeatability and accuracy rating percentages are based on the full scale (except for salinity).
* 1: Organic solvents, strong acids, and strong alkaline solvents cannot be measured.
* 2: The maximum depth for ion measurements are 100 m for nitric acid ion, chloride ion, fluoride ion, 15 m for calcium ion, ammonia, and 3 m for potassium ion.
* 3: Based on the data measured automatically at 15 minutes intervals. The battery life taken into account. Periodical maintenance and calibration is necessary when a lot of shellfishes and seaweeds exist at the measurement point.
